PRESS RELEASE

FrontierZero Partners with BCS Technology to Bring Continuous SaaS Visibility to Australian Enterprises

Dubai, UAE — August 7th, 2025

FrontierZero, the SaaS security platform helping companies secure their SaaS and AI environments, is proud to announce a new partnership with **BCS Technology**, a Sydney-based technology consulting firm known for its enterprise-scale solutions across banking, healthcare, and government.

This partnership brings **FrontierZero's real-time SaaS visibility, misconfiguration detection, and identity-aware risk management** to BCS Technology's clients across Australia—many of whom are navigating large-scale digital transformation, expanding SaaS toolsets, and growing regulatory scrutiny.

Together, FrontierZero and BCS will launch joint go-to-market programs, offer pre-integrated deployments, and support compliance-heavy sectors such as finance and critical infrastructure.

> "We're seeing increasing demand from large organizations in Australia who've moved fast with SaaS but are now asking: 'Do we actually know what's connected?'" said **Karl McGowan**, Co-founder of FrontierZero. "BCS's deep local presence and enterprise experience make them the ideal partner to bring our platform to complex, compliance-focused environments."

About BCS Technology

BCS Technology is a global IT consulting and professional services firm with a strong presence in Australia and the APAC region. With clients ranging from leading global airlines to tier-one banks and national health networks, BCS helps organizations succeed through people, technology, and innovation—modernizing systems, improving data security, and building scalable digital platforms by combining deep technical expertise with business insight to solve complex challenges.

Unlike traditional consultancies, BCS combines industry-specific knowledge with modern engineering practices to deliver fast, secure digital transformation.

The team brings hands-on experience across cloud, AI, and security—including identity management, risk frameworks, and compliance automation. Their goal? Deliver real, measurable outcomes for customers navigating complexity at scale.

> "Many of our clients are adding new SaaS tools faster than they can secure them," said **Asim Salim**, **Chief Technology Officer** at BCS Technology. "We've seen

teams struggle with unmonitored integrations, forgotten admin accounts, and growing pressure to meet compliance standards like ISO 27001 and SOC 2. FrontierZero gives us a clear, real-time view across the SaaS stack—so we can help our clients spot risks early, stay compliant, and keep control without slowing innovation."

Why FrontierZero?

As organizations expand their use of SaaS and AI tools, the complexity of managing access, identities, and integrations grows exponentially. Every new app, account, and connection increases the chances of something slipping through the cracks—whether it's a forgotten admin login, a bot with excessive permissions, or an unapproved AI tool connecting to sensitive data.

FrontierZero was built to solve that problem.

FrontierZero gives organizations complete visibility into every identity, app, and integration across their SaaS environment. Unlike traditional security tools, which rely on snapshots or static rules, FrontierZero continuously monitors for real-time changes, so when something breaks, drifts, or looks suspicious, it's caught fast.

With FrontierZero, organizations gain:

- **Clear visibility** into every identity, app, and connection
- **Smart alerts** that highlight real risk, like missing MFA or excessive access
- **Simpler audits and stronger compliance** across SOC 2, ISO 27001, and more

Whether you're trying to meet regulatory expectations, prevent lateral movement, or finally get control of your SaaS sprawl, FrontierZero delivers clarity when it matters most.
